Project Brief

It's a Salesforce solution for managing customers' loan applications, from a potential client to a Lead phase until it is converted, into Account, Contact and Opportunity. Then apply for the loan; it'll go through stages of draft, credit review, approval or decline, disbursement, and repayments. It combines data modelling, record types, validations, automations, and agents.

The implementation includes a collateral screen flow launched through Loan Application record, automation that synchronizes Loan Application outcomes with the related Opportunity. An Agentforce agent that can assist Sales Reps to Create, Retrieve, Update and Delete Loan Applications.

Data Model

Object	Purpose	Relationships
Lead	A potential customer	After conversion, Contact, Account, Opportunities
Contact	The customer/ person information	One Contact can have Multiple Loan Applications
Account	Customer / Account context	Related to Contact and Service records
Opportunity	The deal associated with the Loan	Loan Application has Lookup to Opportunity
Case	Customer Service issues/ inquiry	Created through Email-to-Case
Loan Application	The main loan management record	Contact, Opportunity
Repayment	Tracks loan repayments activity	Master-Detail relationship to Loan Application
Collateral	Valuable assets if customer fails to pay the Loan	Master-Detail relationship to Loan Application

Schema Builder

The Salesforce Schema Builder provides a visual representation of the Loan Management System's data architecture. The Loan Application serves as the central business object and is connected to the Contact, Opportunity, and Collateral objects.

The model uses both Lookup and Master-Detail relationships to establish dependencies between records. Account and Contact support customer management, Opportunity supports the sales process, Collateral manages loan security, and Case supports customer service. This data model provides a structured foundation for the LMS automation, Agentforce functionality, reporting, and business processes.

Business Rules

1. If you're applying for a home loan and your requested amount is greater or equal to R1 000 000 and your risk score 5 or less, then you automatically must apply for a collateral.
2. Home Loan: Please make sure the Requested Amount is Greater than R250 000 and less than R5 Million
3. Personal Loan: Please make sure the Requested Amount is Greater than R5000 and less than R500000
4. Vehicle Loan: Please make sure the Requested Amount is Greater than R100 000 and less than R3 Million

Validation Rules

- Disbursement date: You cannot disburse an application without having a date.
  You cannot enter the previous date. Please enter the future date.
- Risk Score: The risk score cannot be less than 1 or greater than 10.
- Interest Rate: Please make sure that the values are within 0 and 100.

Users and Roles

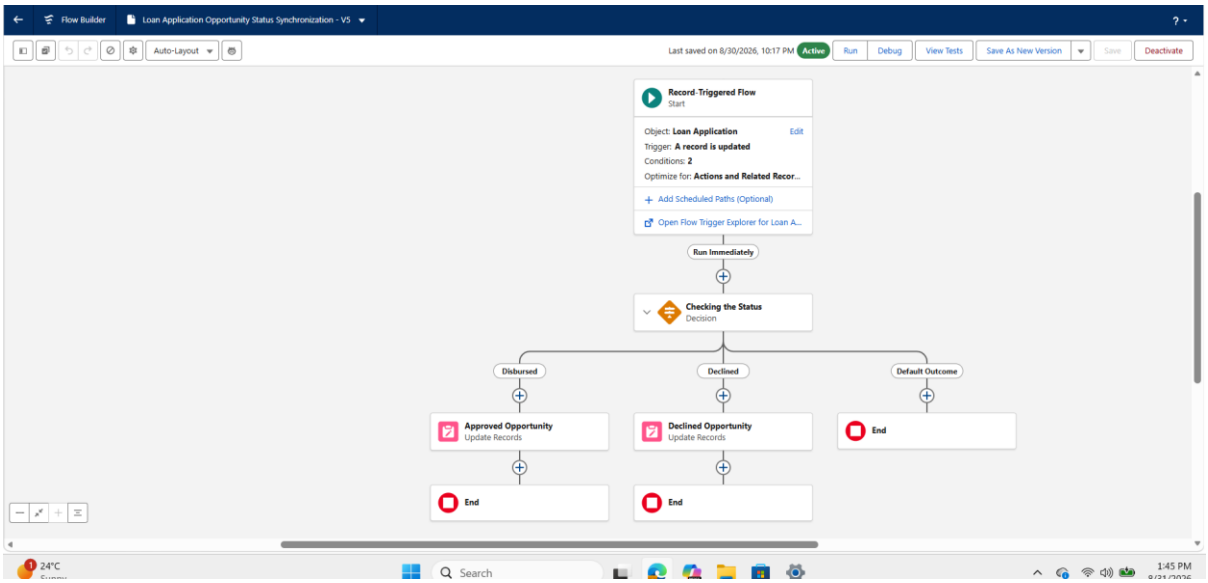

- **Light Yagami is the Sales Rep:** His duty is to create and manage customer information / Contact, capture Loan Applications, collect required documents, submit loan applications for credit review. After the loan is approved, they can disburse the loan to the customer. He can use the Agent as an aid to the loan application, creating, updating, retrieving, and deleting applications. He can only read the interest rate and risk score but cannot edit the fields
- **Kira Mokoena is the Credit Officer:** Review submitted loan applications, check customer information and documentation, evaluate the requested amount, assign the risk score and interest rate, decide if application is approved or declined.
- **Itachi Uchiha is the Credit Manager:** Oversees the credit team, reviews higher-risk or significant loan applications, makes or approves final credit decisions, and monitors the overall credit process.
- **Goku Kakarot is the Service Agent:** Handles customer enquiries and issues, manages Cases created through Email-to-Case, communicates with customers, and tracks cases through resolution.
- **Clement Thipe is the System Administrator:** Manages users, profiles, roles, permissions, security, objects, fields, flows, validation rules, queues, reports, dashboards, Agentforce, and another Salesforce configuration.

Loan Application Status Lifecycle

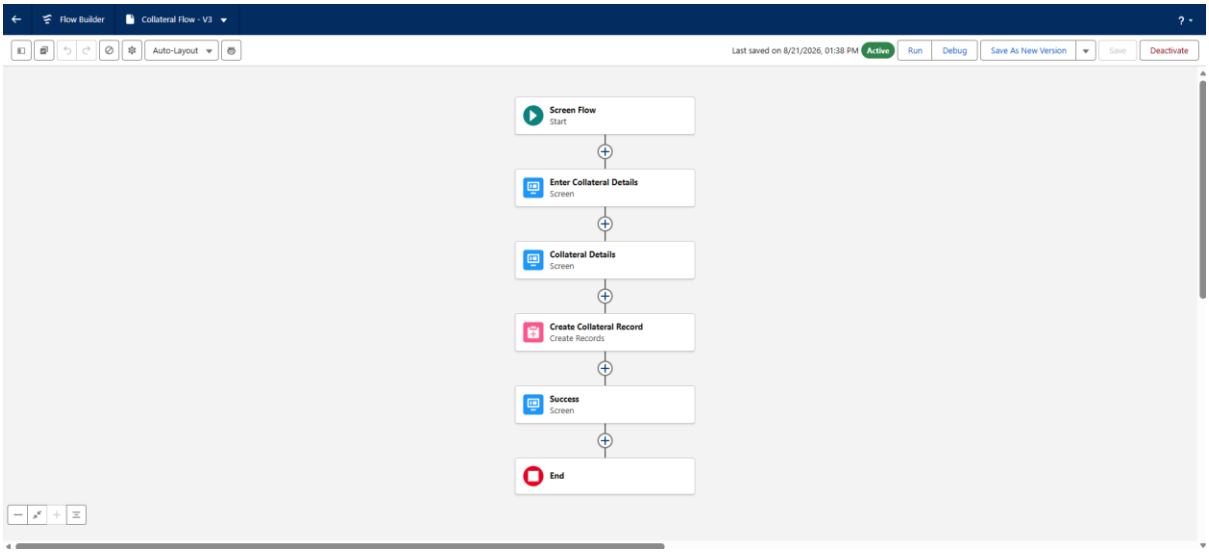

1. Draft: The first stage of the Application
2. Docs Pending: This is the stage where documents are being taken
3. Submitted: Application submitted for processing
4. Credit Review: Credit Officer reviews the application
5. Declined: Application rejected, reason is required
6. Approved: The application is accepted
7. Disbursed: Approved loan has been disbursed to the customer

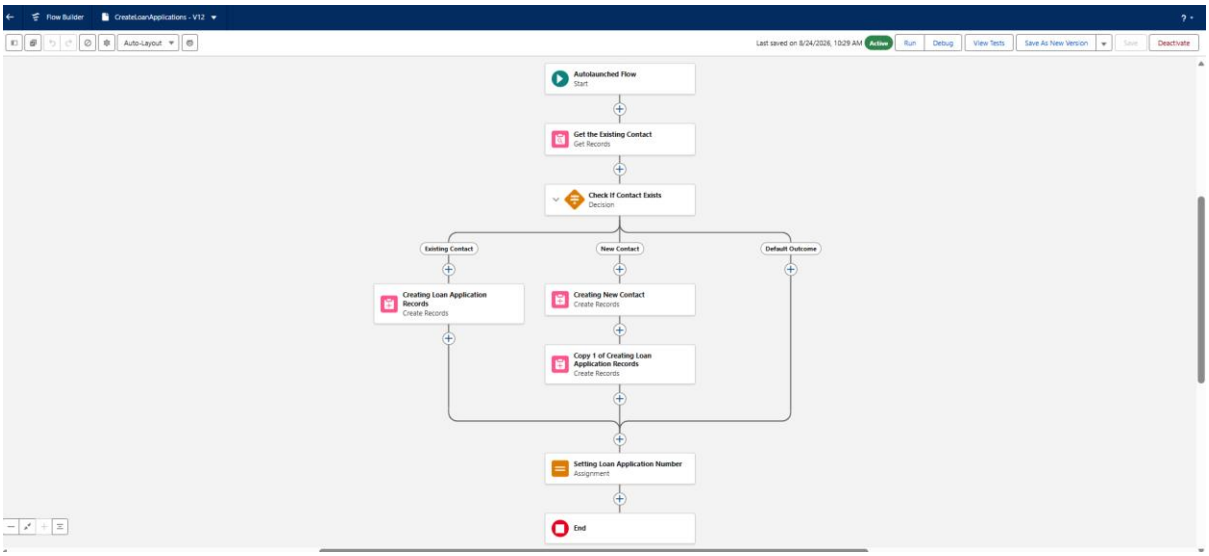

Flow Automation

1. **Loan Application Approval:** This flow runs and Send email to the Customer if their Loan is **Approved**
2. **Loan Application Status Synchronization**: When the Loan Application status is **Disbursed,** the related Opportunity stage changes to **Closed Won**.
   When the Loan Application status is **Declined,** the related Opportunity stage changes to **Closed Lost**.

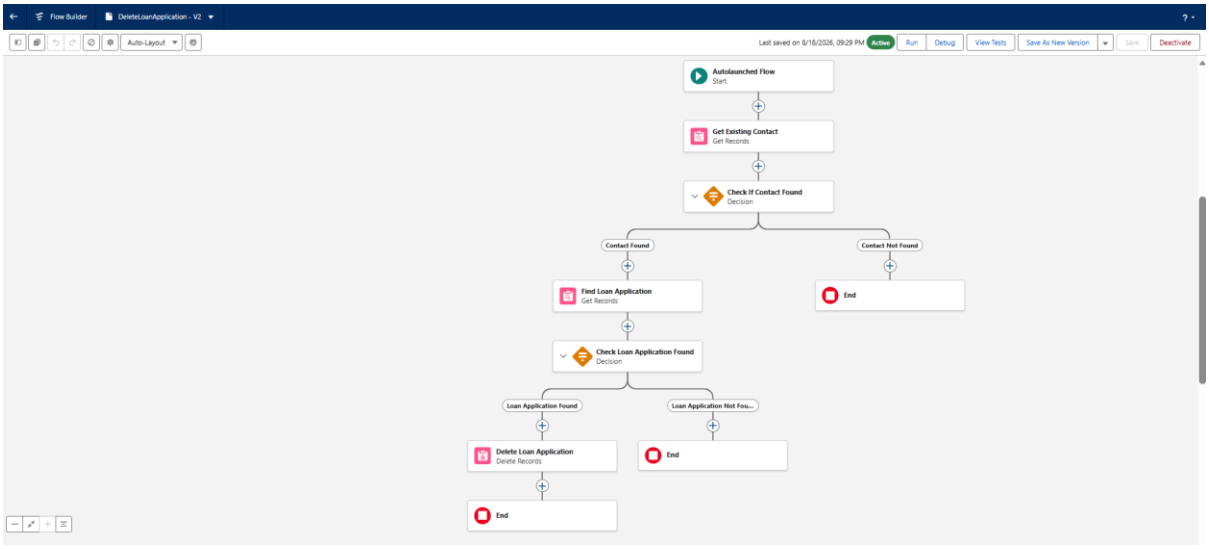

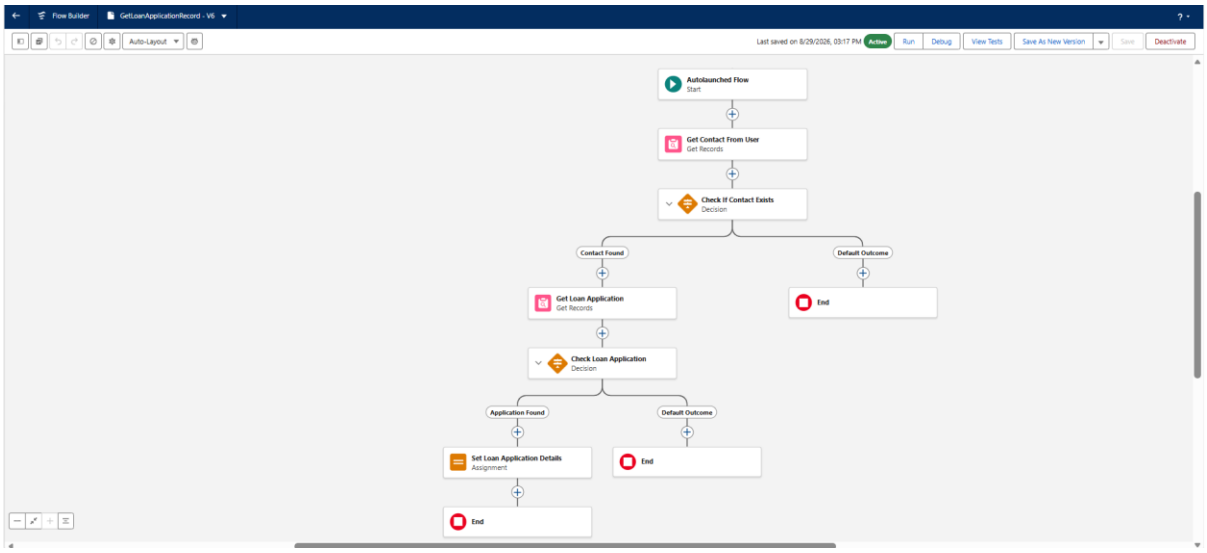

3. **Loan Application Paid in Full:** When the loan repayment has been paid in full, the customer receives an email, telling them that their loan payment has been paid in full.
4. **Repayment Status Flow:** This flow runs when the penalty fee in the repayment object is greater than R0.00; it runs and updates the payment status to payment overdue.
5. **Collateral Flow:** When the risk score is less than 5 and the requested amount is greater than a R1 000 000 when applying for home loan and vehicle loan.

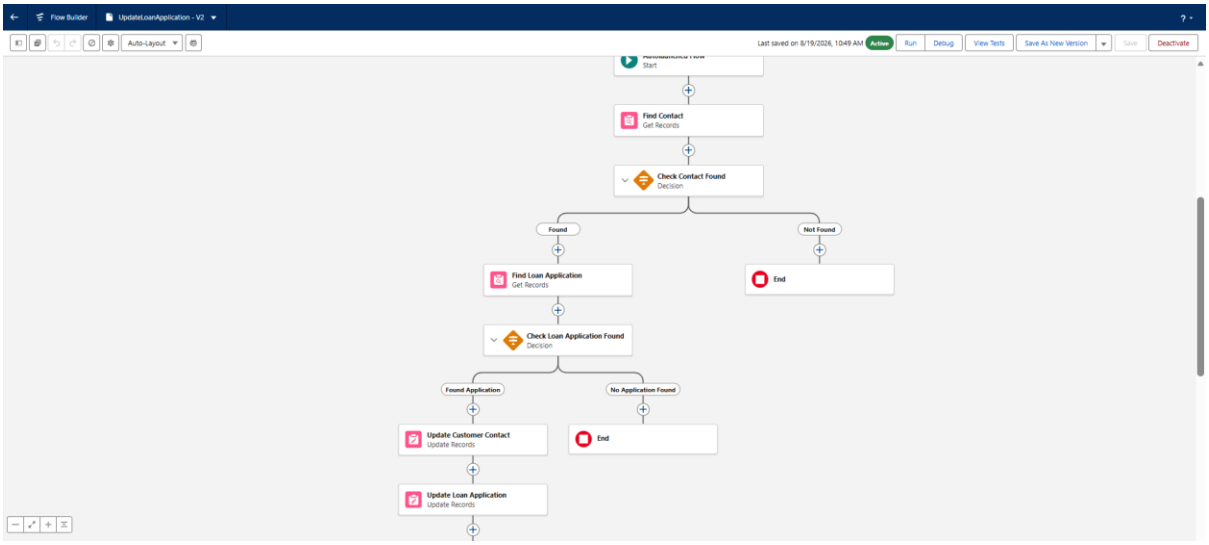

6. **The Agent Flows:** The agent uses a flow that is being called by 4 actions: Here are the actions
   - **Creating Loan Application:** This flow creates the loan application by checking if the contact exists. If it doesn't exist, it creates the contact first, then proceed to create the loan application.
   - 

   - **Deleting Loan Application:** When deleting the loan application, you need to enter a first name, last name and email, this will get the loan application from the system then it'll delete the application.

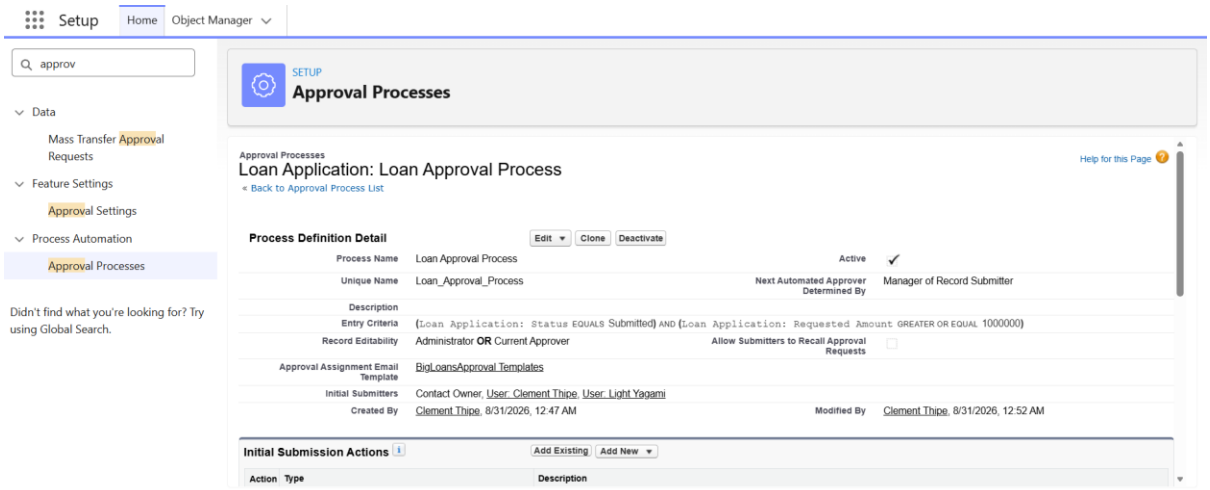

- 

- **Get Loan Application:** This action retrieves loan application by checking if the contact exists, when you enter your first name and last name then it retrieves the record.
- 

- **Update Loan Applications:** This action updates the loan application fields, you can update, requested amount, interest rate, risk score, term months, email, first name and last name

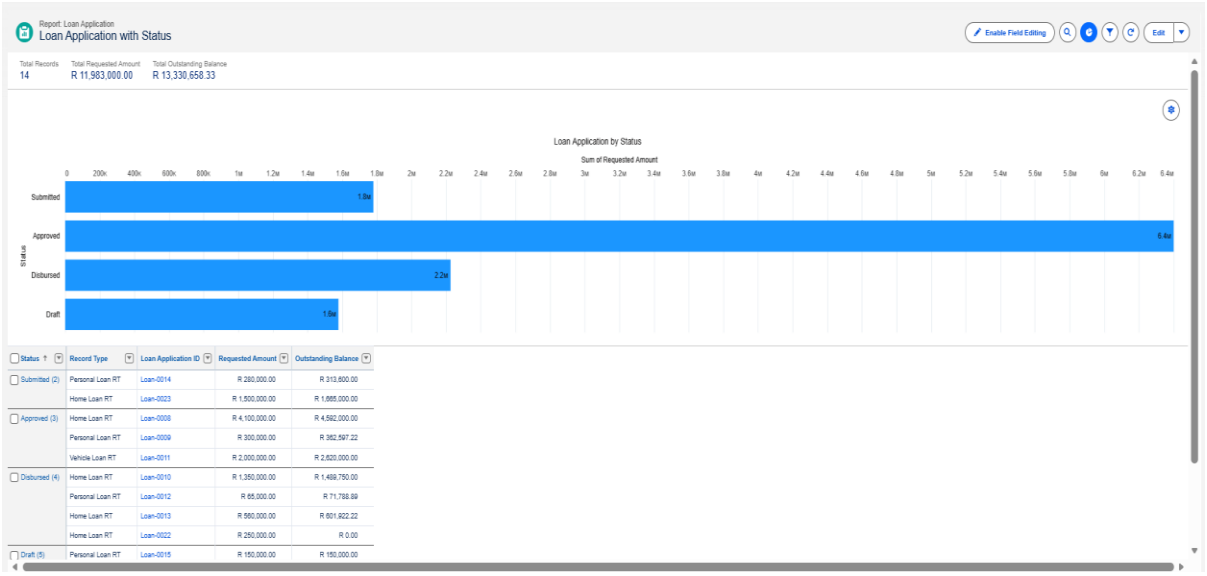

- 

Approval process

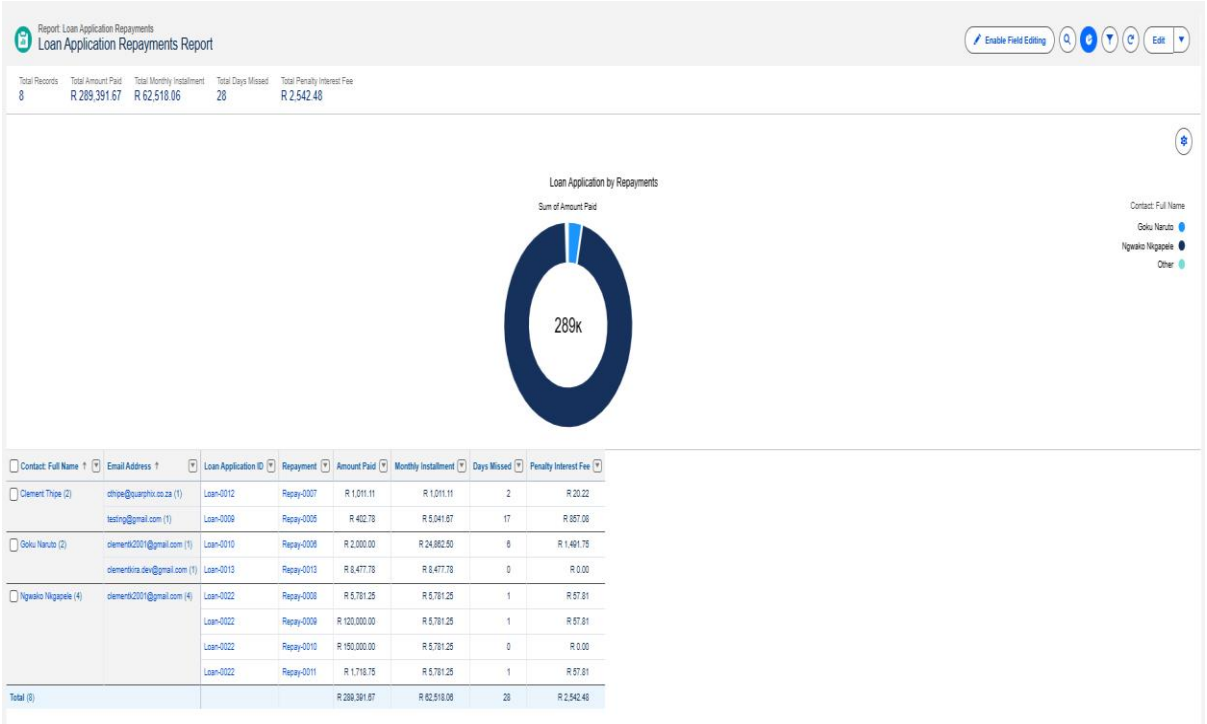

The entry criteria to the approval process are when the loan application status is submitted and the requested amount is greater or equal to R1 000 000. The Credit or System Administrator can send the record for approval. Then the Credit Manager will Approve or Reject the Application, if they decline the application, they'll need to provide a reason for decline.

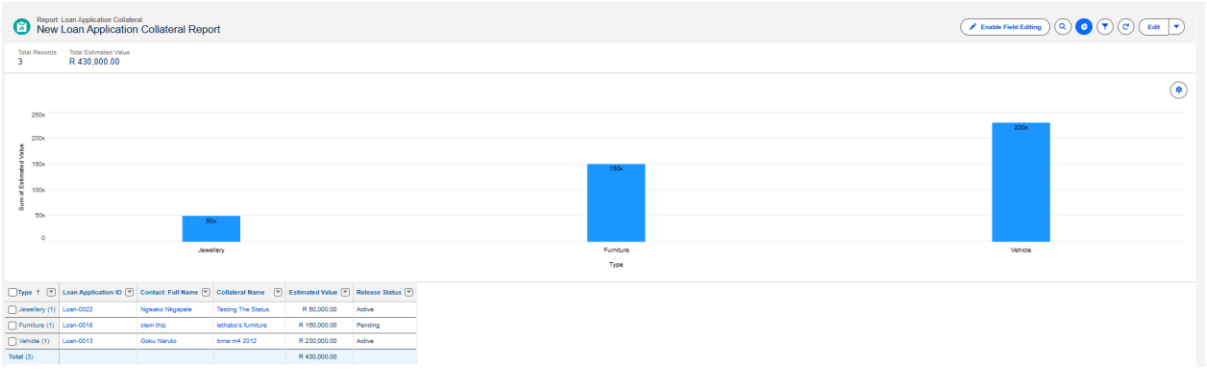

Reports

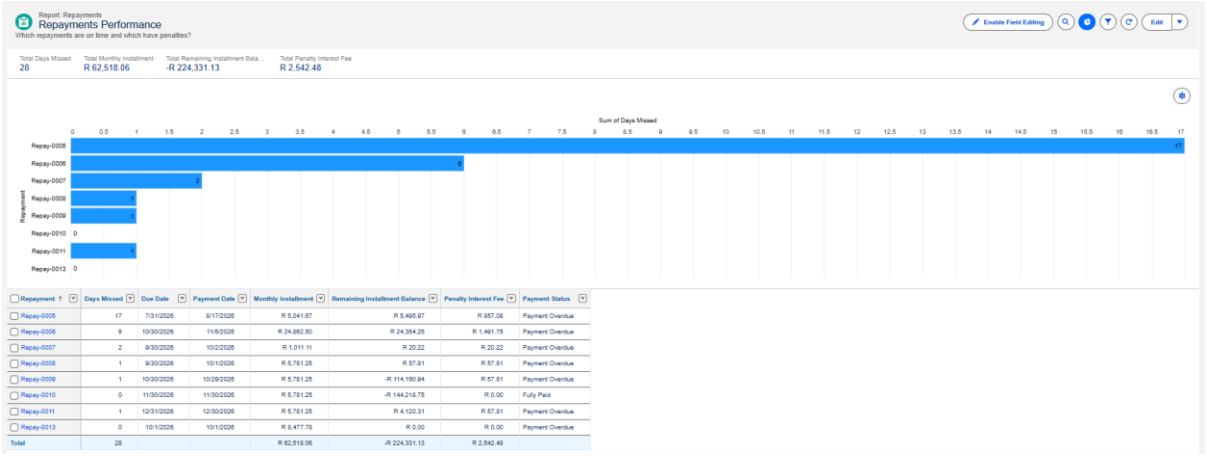

This report enables sales reps and system administrator to track application volumes, monitor conversion rates, and make informed decisions to improve operational efficiency and customer service.

The Loan Application Repayments Report provides a summary of loan repayments made by borrowers, including amounts paid, monthly installment obligations, days missed, and penalty interest charged. It helps monitor repayment performance, identify overdue accounts, track outstanding payment risks, and measure loan portfolio health.

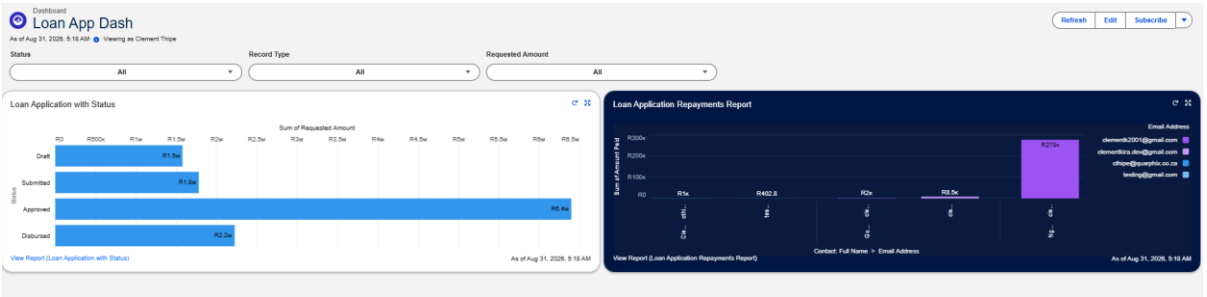

The Loan Application Collateral Report provides a summary of collateral assets linked to loan applications, including collateral type, estimated value, ownership details, and release status. It helps assess loan security, monitor collateral coverage, and supports lending risk management decisions.

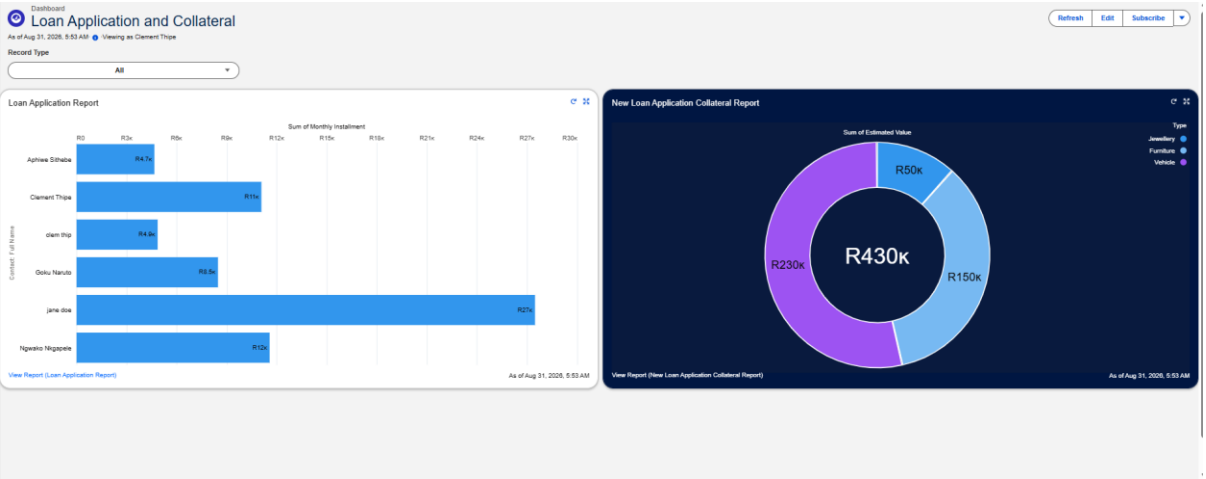

The Repayments Performance Report monitors the performance of loan repayments by tracking missed payment days, overdue repayments, remaining installment balances, and penalty interest fees. It helps companies assess customer repayment behavior, identify delinquent accounts, and improve collections management.

Dashboards

The Loan App Dashboard provides a view of loan application activity and repayment performance, enabling sales rep to monitor the lending pipeline, track approved and disbursed

loans, analyze requested loan amounts, and evaluate customer repayment. It supports operational oversight, monitoring, and data-driven decision-making.

The Loan Application and Collateral Dashboard provides an overview of loan application activity and collateral coverage for selected loan products. It enables users to analyze monthly installment obligations by customers and assess the value and distribution of collateral assets securing approved loans.

Conclusion

This project helped me understand how Salesforce can be used to solve a real business problem. I was able to build a system that manages the loan process, reduces manual work, improves data accuracy, and gives users better visibility through reports and dashboards. It also gave me practical experience with Salesforce automation, security, service features, and Agentforce.

The Salesforce Loan Management System demonstrates an end-to-end business solution covering customer capture, loan creation, credit review, collateral, repayments, opportunity synchronization, Agentforce operations and customer service. The project also demonstrates practical Salesforce administration and automation skills through data modelling, record types, Flow Builder, queues, permissions, reporting and service configuration.
